1. (Once Amended) A reflection type liquid crystal display, comprising:

a pair of substrates disposed opposite to each with a liquid crystal layer disposed therebetween;

a plurality of switching elements formed on one surface of at least one of said pair of substrates;

a reflective layer constituted of a same material as a material constituting said plurality of switching elements and simultaneously formed during formation of said plurality of switching elements; and

a transparent pixel electrode formed on said reflective layer via an insulation layer and connected to at least one electrode included in at least one of said plurality of switching elements.

2. (Once Amended) The reflection type liquid crystal display according to claim 1, wherein said plurality of switching elements includes at least a thin film transistor, and said reflective layer is formed of the same material as a material of a gate electrode of said thin film transistor and constituted on the same plane as a plane of said gate electrode.

5. (Once Amended) The reflection type liquid crystal display according to claim 1, wherein a shielding layer is disposed on an area of said plurality of switching elements.

8. (Once Amended) The reflection type liquid crystal display according to claim 1,

wherein said redective layer at least one of aluminum and an aluminum alloy.

Please add new claims 25 and 26 as follows:

25. A reflection type liquid crystal display, comprising:

a pair of substrates disposed opposite to each other via a liquid crystal layer;

a plurality of switching elements formed on one surface of said pair of substrates;

a reflective layer constituted of a same material as a material constituting said switching element and simultaneously formed during formation of said switching elements;

a transparent pixel electrode formed on said reflective layer via an insulation layer and connected to one electrode constituting said switching element;

wherein said switching element is a thin film transistor, and said reflective layer is formed of the same material as a material of a gate electrode of said thin film transistor and constituted on the same plane as a plane of said gate electrode; and

wherein a rough portion is formed in the lower layer of said reflective layer, and said reflective layer is formed to cover said rough portion.

26. A reflection type liquid crystal display, comprising:

a pair of substrates disposed opposite to each other via a liquid crystal layer;

a plurality of switching elements formed on one surface of said pair of substrates;

a reflective layer constituted of a same material as a material constituting said switching element and simultaneously formed during formation of said switching elements;

a transparent pixel electrode formed on said reflective layer via an insulation layer and connected to one electrode constituting said switching element;

wherein said thin film transistor comprises a gate electrode electrically connected to a scanning line, a gate insulation film formed to cover said gate electrode, a semiconductor layer formed on said gate insulation film, a drain electrode electrically connected to a signal line, and a source electrode electrically connected to said transparent pixel electrode, and said reflective layer is electrically separated from said gate electrode; and

wherein a rough portion is formed in the lower layer of said reflective layer, and said reflective layer is formed to cover said rough portion.

## **REMARKS**

This paper is being provided in response to the June 21, 2001 Office Action for the above-referenced application. In this response to the outstanding Office Action, applicants have cancelled claim 15 and non-elected claims 16-24, amended claims 1, 2, 5, 8 and added new claims 25 and 26, in order to more particularly point out and distinctly claim that which applicants deem to be the invention. Applicants respectfully submit that the modifications to the claims are all supported by the originally filed application. In particular new independent claim
